Allowable Subject Matter

1. Claims 33, 35-38, 40-47 and 49 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Applicant's independent claims recite, *inter alia*, a medium access control system in a wireless network, comprising an access point equipped with a space division multiple access compatible multi-beam antenna and a plurality of transceivers that can respectively be simultaneously connected to different antenna beams and transmit data using a superframe, and one or more stations spaced apart in a reception space of a wireless local area network, wherein the superframe has a timing structure comprising a periodically transmitted beacon frame transmitted by the access point that reports existence of a wireless network and provides a timing reference to each station on the network, a supervised access mode that is a period in which the access point multi-beam antenna is configured in a directional pattern, the access point controls access to a wireless channel and adjusts transmission with a plurality of stations by utilizing multi-beam antenna characteristics such that simultaneous transmissions with the plurality of stations can be implemented on a same wireless channel, and each station follows predetermined rules defined by the access point or by a network coordinator, an unsupervised access mode that is a period in which the access point multi-beam antenna is configured in an omni-directional pattern, and each station executes rule-free, contention based access to a wireless channel and signaling whereby the access point or terminates the supervised access mode or the unsupervised access mode, wherein the beacon frame provides each station with the multi-beam antenna

characteristics of a directional pattern or omni-directional pattern, when the multi-beam antenna characteristic is the directional pattern, the unsupervised access mode is executed in order to detect a new station in the reception space and when the multi-beam antenna characteristic is the omni-directional pattern, the unsupervised access mode is executed in a case where a rogue station is detected in the reception space.

The closed prior art of record, Adachi and Gurbuz differs by not teaching the specifics regarding when using the directional antenna pattern, the unsupervised access mode being executed in order to detect a new station in reception space and when the antenna is an omni-directional pattern, the unsupervised access mode is used when a rogue station is detected.

Applicant's invention recites a particular combination that is neither taught nor suggested in the prior art. Applicant's invention is allowed for this reason and for the reasons stated by the Applicant in the responses filed on 1/9/2006, 10/29/2009, 3/29/2010 and 9/23/2010.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MATTHEW SAMS whose telephone number is (571)272-8099. The examiner can normally be reached on M-F 8-6.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Lester Kincaid can be reached on (571) 272-7922. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
